This project is about rdist.

You will use rdist to install a file from **panther** to the machine you administer.

1) On the machine you administer, if you didn't include rdist in your reload, mount the cd from **panther** and install the rdist capabilities.

2) Create a file called **junk** in your home directory (**~css476x4**). Put some ASCII message in this file like "Hello". This is the file to be distributed from **panther** to your machine.

3) Set up an rdist command file that does the following:

A) copies the file onto your machine as **/tmp/junk**

B) changes the mode on that file to be **755**

4) Set the machine you administer so that the **bob** account on that machine (or whatever account you created) will accept rdist from your class account on **panther**.

5) login to **panther** (using your class account). Run the rdist command.

Check on the machine you administer to make sure the junk file appeared and has the right mod.

Submit: what exactly did you do at step (4), a copy of your rdist command file and the exact form of the rdist command you used.
